

# Quark core and pion cloud effects in resonant meson electro-production

Bojan Golli

Faculty of Education, University of Ljubljana and  
J. Stefan Institute, Ljubljana, Slovenia

in collaboration with  
Simon Širca (Ljubljana)  
Manuel Fiolhais, Pedro Alberto (Coimbra)

7th International Workshop on Pion-Nucleon Partial-Wave Analysis  
and the Interpretation of Baryon Resonances  
Camogli, 23 – 27 September 2013

# Outline

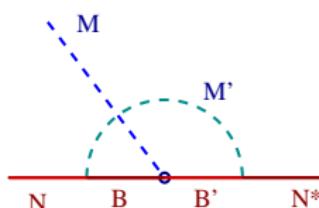

- ▶ Aims
- ▶ A short survey of the coupled channel approach incorporating quasi-bound quark-model states and meson clouds
- ▶ The underlying quark models
- ▶ Meson cloud effects in the region of the  $\Delta(1232)$  and  $N(1440)$  resonances
- ▶ Analysis of the S11 wave resonances
- ▶ D-wave resonances: D13, D33 and D15
- ▶ Summary

# Aims

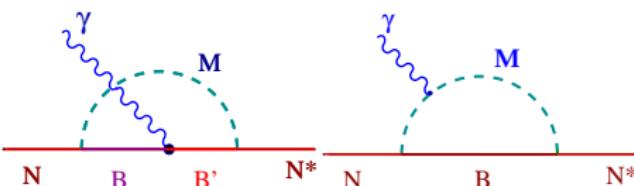

- ▶ An attempt to answer the long standing question: what is the principal mechanism that explains the structure of individual resonances: **excitation of the quark core or dynamical generation through baryon-meson coupling?**
- ▶ To use **explicit quark degrees of freedom** that provide "natural" constraints on the baryon meson **coupling constants** as well as the **range of the interaction** (cut-off); the resulting number of free parameters thus becomes considerably smaller.
- ▶ To assess the importance of the meson cloud in scattering and electroproduction.
- ▶ ***Fil rouge*** of the talk: to identify the processes where the meson cloud effects are (more or less) clearly manifested.

# Meson-cloud effects, formally:

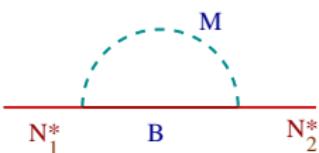

- ▶  $MNN^*$  vertex renormalization

- ▶  $\gamma NN^*$  renormalization

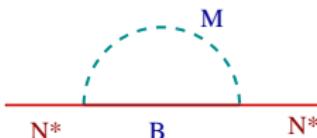

- ▶ resonance mixing

e.g. P11  $N^0(939) + N^0(1440)$ ,  
 S11  $N^0(1535) + N^0(1650)$ ,  
 D13  $N^0(1520) + N^0(1700)$

$$N^* = \cos \theta N_1^{(0)} + \sin \theta N_2^{(0)}, \quad \theta = \theta(W).$$

- ▶ self energy

# Quark models with mesons

A natural environment: the model in which the mesons are linearly coupled to the quark core:

$$H = H_{\text{quark}} + \int dk \sum_{lmt} \left\{ \omega_k a_{lmt}^\dagger(k) a_{lmt}(k) + [\textcolor{red}{V}_{lmt}(k) a_{lmt}(k) + \text{h. c.}] \right.$$

$$T(k, k_0) = \pi \sqrt{\frac{\omega_k}{k}} \langle \Psi^-(k_0) | |V(k)| | \Phi_N \rangle$$

$$|\Psi(W)^\pm\rangle = a^\dagger(k_0) |\Phi_N\rangle + |\chi^\pm\rangle, \quad |\chi^-\rangle = -\frac{1}{H - W \mp i\epsilon} V(k) |\Phi_N\rangle$$

Generalized to

$$K^{JT}(k, k_0) = -\pi \sqrt{\frac{\omega_k E_N}{kW}} \langle \Psi_{JT}^P(W) | |V(k)| | \Phi_N \rangle$$

The principle value (PV) states

$$|\Psi_{JT}^P\rangle = \sqrt{\frac{\omega_0 E_N}{k_0 W}} \left\{ \left[ a^\dagger(k_0) |\Phi_N\rangle \right]^{JT} - \frac{\mathcal{P}}{H - W} [V(k_0) |\Phi_N\rangle]^{JT} \right\}$$

# Construction of the K-matrix

**Aim:** to include many-body states of quarks in the scattering formalism  
(Chew-Low type approach)

Construct K-matrix in the spin-isospin (JI) basis:

$$K_{M'B' MB}^{JI} = -\pi \sqrt{\frac{\omega_M E_B}{k_M W}} \langle \Psi_{JI}^{MB}(W) | |V_{M'}(k)| | \Psi_{B'} \rangle$$

dressed states

by using principal-value (PV) states

$$|\Psi_{JI}^{MB}(W)\rangle = \sqrt{\frac{\omega_M E_B}{k_M W}} \left\{ \left[ a^\dagger(k_M) |\Psi_B\rangle \right]^{JI} - \frac{\mathcal{P}}{H - W} [V(k_M) |\Psi_B\rangle]^{JI} \right\}$$

normalized as

$$\langle \Psi^{MB}(W) | \Psi^{M'B'}(W') \rangle = \delta(W - W') \delta_{MB, M'B'} (1 + \mathbf{K}^2)_{MB, MB}$$

## Ansatz for the channel PV states

$$|\Psi_{JI}^{MB}\rangle = \sqrt{\frac{\omega_M E_B}{k_M W}} \left\{ [a^\dagger(k_M) |\Psi_B\rangle]^{JI} \right.$$

free meson  
(defines the channel)

$$+ \sum_{\mathcal{R}} c_{\mathcal{R}}^{MB} |\Phi_{\mathcal{R}}\rangle$$

bare (genuine) baryons (3q)

$$\left. + \sum_{M'B'} \int \frac{dk \chi^{M'B' MB}(k, k_M)}{\omega_k + E_{B'}(k) - W} [a^\dagger(k) |\Psi_{B'}\rangle]^{JI} \right\}$$

meson “clouds”  
with amplitudes  $\chi$

Above the meson-baryon ( $MB$ ) threshold:

$$K_{M'B' MB}(k, k_M) = \pi \sqrt{\frac{\omega_M E_B}{k_M W}} \sqrt{\frac{\omega_{M'} E_{B'}}{k_{M'} W}} \chi^{M'B' MB}(k, k_M)$$

# T matrix for scattering and electroproduction

Solution for the K matrix

$$K_{MB,M'B'} = \pi \sqrt{\frac{\omega_M E_B}{k_M W}} \sqrt{\frac{\omega_{M'} E_{B'}}{k_{M'} W}} \left[ \sum_{\mathcal{R}} \frac{\tilde{\mathcal{V}}_{B\mathcal{R}}^M \tilde{\mathcal{V}}_{B'\mathcal{R}}^{M'}}{(M_{\mathcal{R}} - W)} + \mathcal{D}_{MB,M'B'} \right]$$

$$|\tilde{\Phi}_{\mathcal{R}}\rangle = \sum_{\mathcal{R}'} U_{\mathcal{R}\mathcal{R}'} |\Phi_{\mathcal{R}}\rangle \quad \tilde{\mathcal{V}}_{B\mathcal{R}} = \frac{1}{\sqrt{Z_{\mathcal{R}}(W)}} \sum_{\mathcal{R}'} U_{\mathcal{R}\mathcal{R}'} \mathcal{V}_{B\mathcal{R}'}$$

and for the T matrix

$$T_{MB,M'B'} = K_{MB,M'B'} + i \sum_{M''K''} T_{MB,M''B''} K_{M''B'',M'B'}$$

Including the  $\gamma N$  channel

$$T_{MB,\gamma N} = K_{MB,\gamma N} + i \sum_{M'K'} T_{MB,M'B'} K_{M'B',\gamma N}$$

$$K_{M'B',\gamma N} = -\pi \sqrt{\frac{\omega_{\gamma} E_N}{k_{\gamma} W}} \langle \Psi_{II}^{M'B'} || \mathcal{V}_{\gamma} || \Psi_N \rangle$$

# Separation of the electroproduction amplitudes

$$\mathcal{M}_{MB\gamma N} = \mathcal{M}_{MB\gamma N}^{(\text{res})} + \mathcal{M}_{MB\gamma N}^{(\text{bkg})}$$

The **resonant part** of the amplitude can then be written as:

$$\mathcal{M}_{MB\gamma N}^{(\text{res})} = \sqrt{\frac{\omega_\gamma E_N^\gamma}{\omega_\pi E_N}} \frac{1}{\pi \mathcal{V}_{NN^*}} \underbrace{\langle \Psi_{N^*}^{(\text{res})}(W) | \tilde{V}_\gamma | \Psi_N \rangle}_{A_{N^*}} T_{MB\pi N}$$

The **helicity amplitude**  $A_{N^*}$  for electro-excitation:

$$A_{N^*} \equiv \langle \Psi_{N^*}^{(\text{res})}(W) | \tilde{V}_\gamma | \tilde{\Psi}_N \rangle$$

The **resonant state** takes the form:

$$|\Psi_{N^*}^{(\text{res})}(W)\rangle = \frac{1}{\sqrt{Z_{N^*}}} \left\{ |\tilde{\Phi}_{N^*}\rangle - \sum_{MB} \int \frac{dk}{\omega_k + E_B - W} \frac{\tilde{\mathcal{V}}_{BN^*}^M(k)}{\omega_k + E_B - W} [a^\dagger(k) |\Psi_B\rangle]^{JI} \right\}$$

# The underlying quark models

- ▶ **σ-model with quarks**  
(bosonized version of the NJL model) (early work, only for  $\Delta(1232)$ )
- ▶ **Chromodielectric model**  
dynamical confinement (early work, only for  $\Delta(1232)$ )
- ▶ **Cloudy Bag Model (current work)**  
extended to pseudo-scalar SU(3) octet and the  $\rho$  meson:

$$\mathcal{L}_{\text{CBM}}^{(\text{quark-meson})} = -\frac{i}{2f} \bar{q} \lambda_a (\gamma_5 \phi_a + \gamma \cdot A_a) q \delta(r - R_{\text{bag}}), \quad a = 1, 2, \dots, 8$$

parameterizes the baryon-meson and baryon-photon coupling constants  
and form factors in terms of " $f_\pi$ " and the bag radius  $R_{\text{bag}}$ .

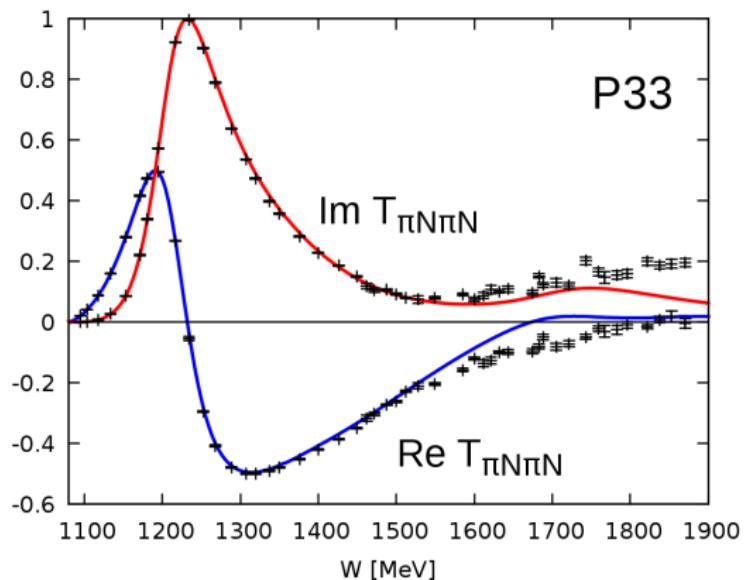

Parameters:

$R_{\text{bag}} = 0.83 \text{ fm}$  (from the ground state calculations)  
 $f_\pi = 76 \text{ MeV}$  (reproducing the experimental value of  $g_{\pi NN}$ )  
 $f_K = 1.2f_\pi, \quad f_\eta = f_\pi \text{ or } 1.2f_\pi, \quad f_\pi < f_\rho < 2f_\pi$   
similar results for  $0.75 \text{ fm} < R_{\text{bag}} < 1.0 \text{ fm}$

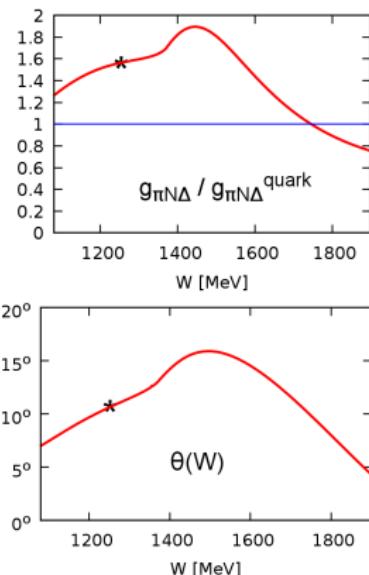

**Free parameters:** bare masses of the resonances

# P33 scattering

Cloudy Bag Model,  $R_{\text{bag}} = 0.83 \text{ fm}$ ,  $f_\pi = 76 \text{ MeV}$

P33

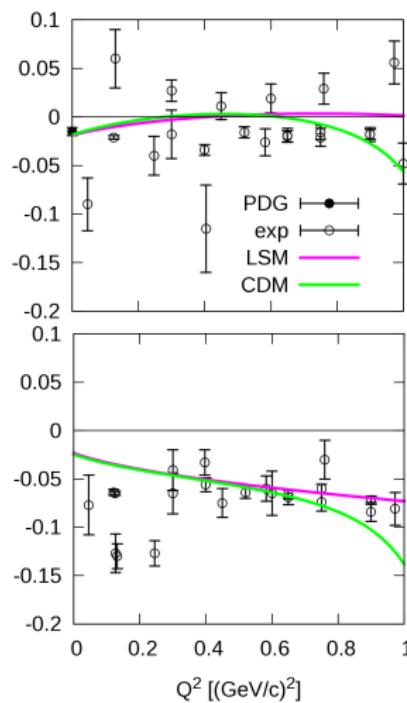

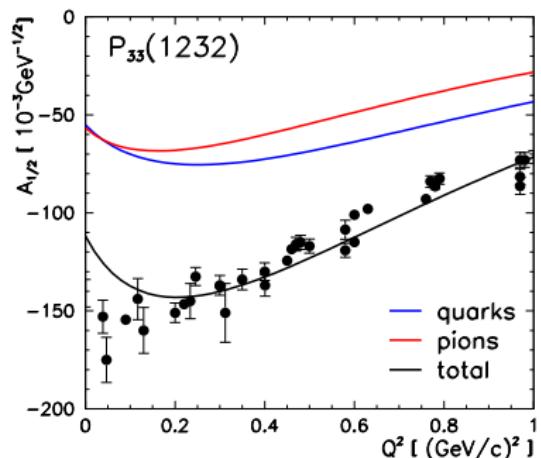

$$\Delta(1232) = \cos \theta (1s)^3 + \sin \theta (1s)^2 (2s)^1 \equiv \cos \theta \Delta^0(1232) + \sin \theta \Delta^0(1600)$$

# $\Delta(1232)$ helicity amplitude

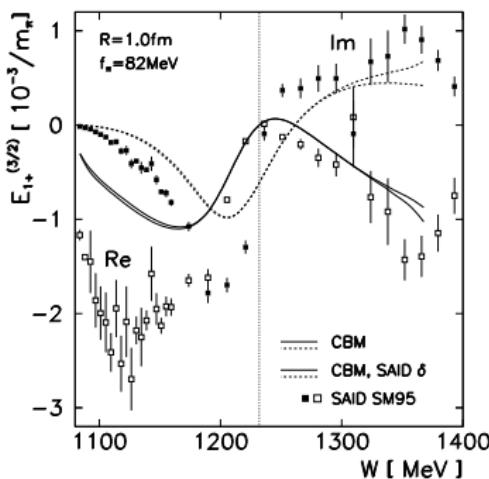

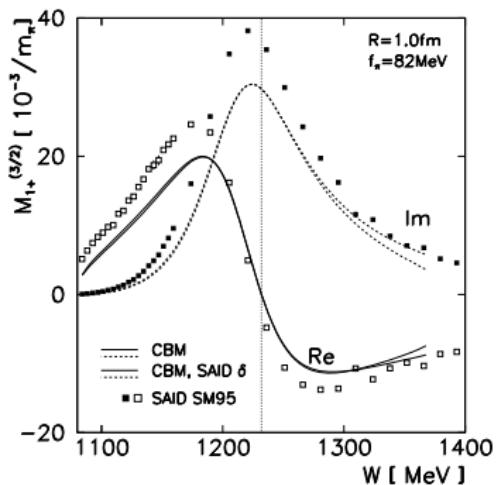

Linear  $\sigma$ -model with quarks (LSM)

Chromodielectric model (CDM)

P.Alberto, M.Fiolhais, S.Širca, B.G.  
PLB 373 (1996) 229.

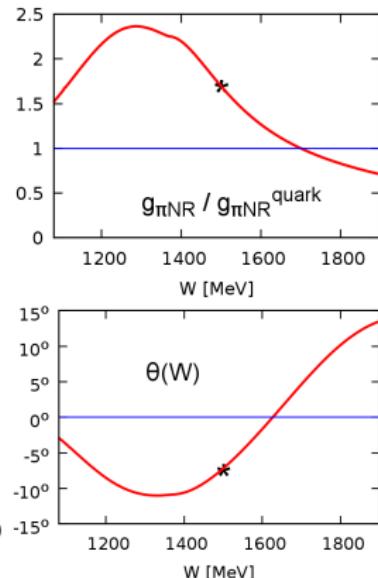

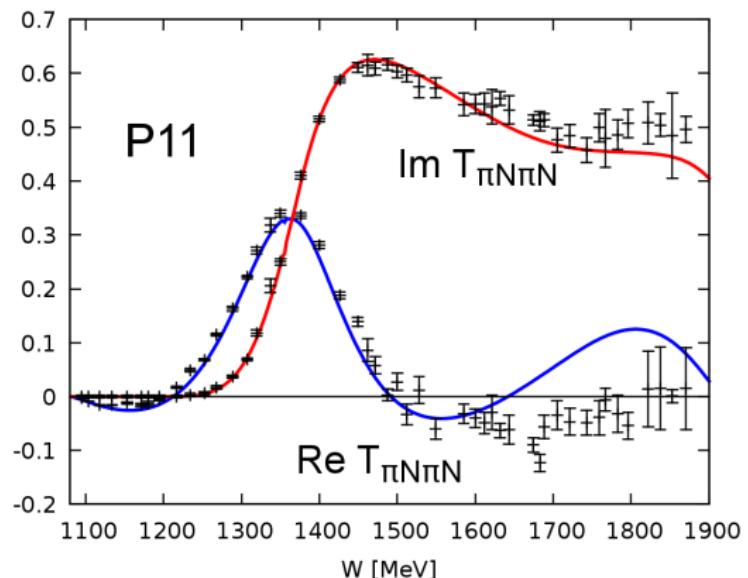

# $\Delta(1232)$ photoproduction

P. Alberto, L. Amoreira, M. Fiolhais, B. G., S. Širca, Eur. Phys. J. A **26** (2005) 99.

# P11 scattering

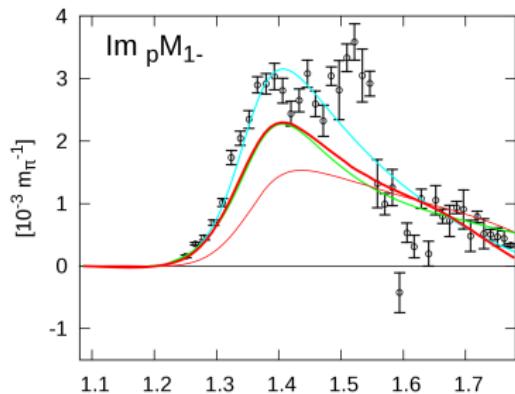

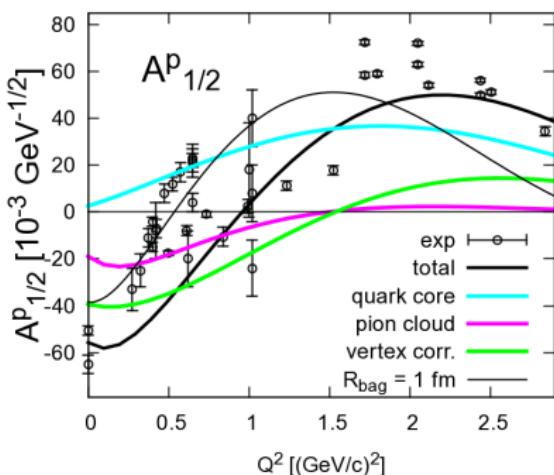

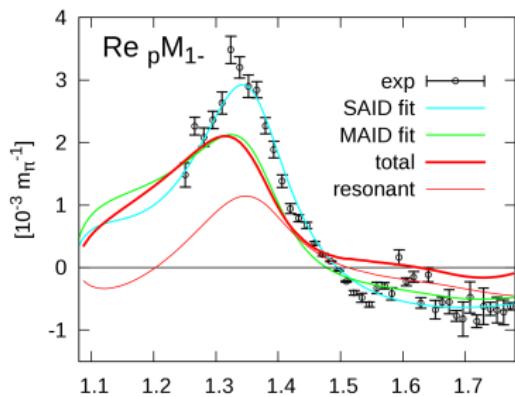

Cloudy Bag Model,  $R_{\text{bag}} = 0.83 \text{ fm}$ ,  $f_\pi = 76 \text{ MeV}$

$$N(1440) = \cos \theta (1s)^3 + \sin \theta (1s)^2 (2s)^1 = \cos \theta N^0(939) + \sin \theta N^0(1440)$$

Included  $N(1710)$ ,  $g_{\pi BN(1710)} \approx \frac{1}{5} g_{\pi BN^*}$

# P11 photoproduction and helicity amplitudes on proton

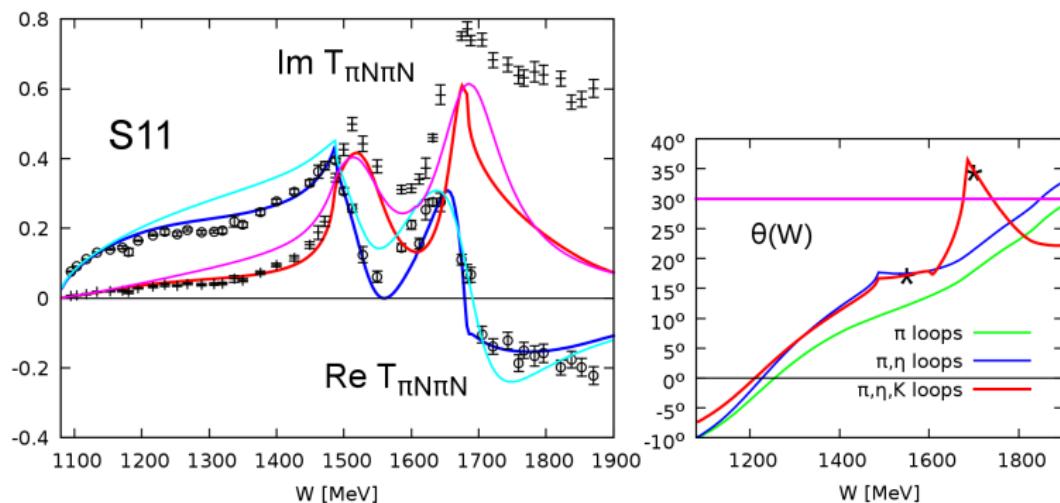

P. Alberto, M. Fiolhais, B. G.,  
J. Marques, PLB **523**, 273 (2001),  
B. G. and S. Širca, Eur. Phys. J. A **38**, 271 (2008),  
B. G., S. Širca, and M. Fiolhais,  
Eur. Phys. J. A **42**, 185 (2009)

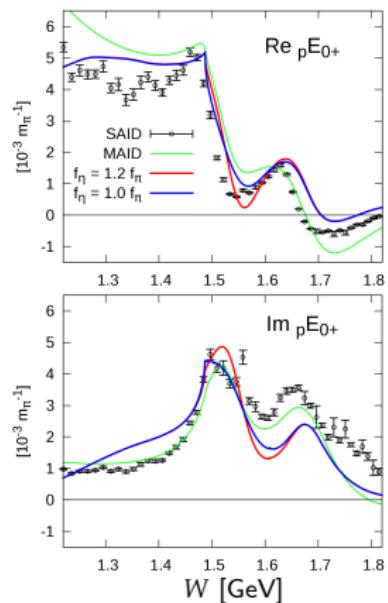

# S11 scattering

Single-quark excitations  $1s \rightarrow 1p_{1/2}$  and  $1s \rightarrow 1p_{1/3}$

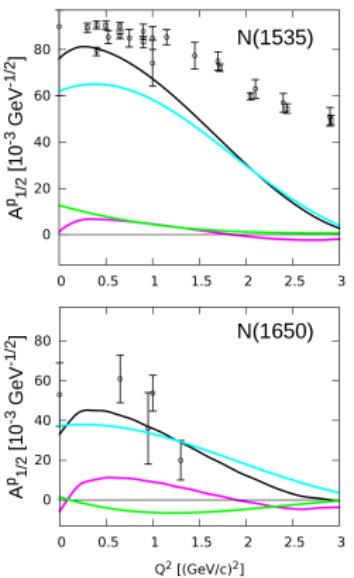

$$N(1535) = -\sin \theta |^4\mathbf{8}_{1/2}\rangle + \cos \theta |^2\mathbf{8}_{1/2}\rangle$$
$$N(1650) = \cos \theta |^4\mathbf{8}_{1/2}\rangle + \sin \theta |^2\mathbf{8}_{1/2}\rangle$$

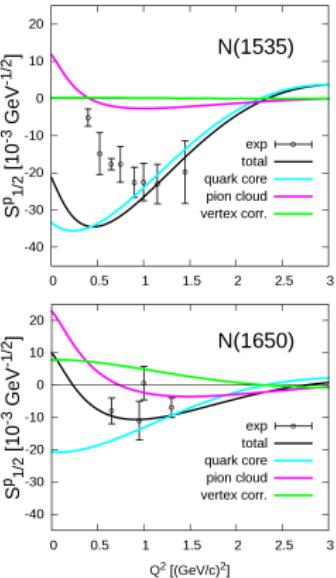

# S11 photoproduction and helicity amplitudes on proton

photoproduction

helicity amplitudes

B. G., S. Širca, Eur. Phys. J. A **47**, 61 (2011)

# D-wave resonances in quark models

Single-quark excitations  $1s \rightarrow 1p_{1/2}$  and  $1s \rightarrow 1p_{3/2}$

D13 resonances:  $N(1520) = -\sin \theta |^4\mathbf{8}_{3/2}\rangle + \cos \theta |^2\mathbf{8}_{3/2}\rangle$   
 $N(1700) = \cos \theta |^4\mathbf{8}_{3/2}\rangle + \sin \theta |^2\mathbf{8}_{3/2}\rangle$

$$^{2S+1}\mathbf{8}_{3/2} = c_{MS}^S |(1s)^2 1p_{3/2}\rangle_{MS} + c_{MA}^S |(1s)^2 1p_{3/2}\rangle_{MA} + c_M^S |(1s)^2 1p_{1/2}\rangle$$

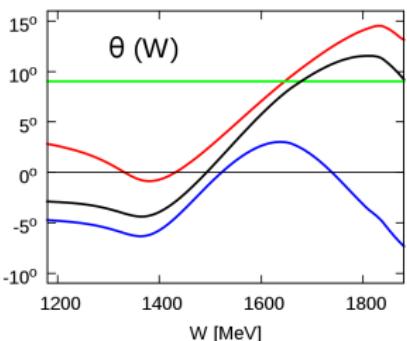

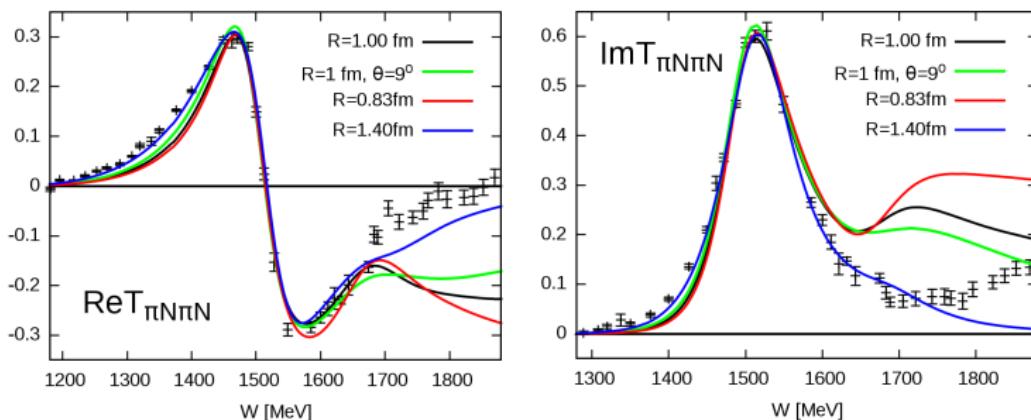

D33 resonance:  $\Delta(1700) = |^2\mathbf{10}_{3/2}\rangle = \frac{\sqrt{5}}{3} |(1s)^2 1p_{3/2}\rangle - \frac{2}{3} |(1s)^2 1p_{1/2}\rangle$ ,

D15 resonance:  $N(1675) = |^4\mathbf{8}_{5/2}\rangle = |(1s)^2 1p_{3/2}\rangle$ .

Considerable modification of quark-meson coupling constants with respect to the corresponding quark-model values:

B. G., S. Širca, Eur. Phys. J. A **49**, 111 (2013)

# D13: elastic scattering amplitudes

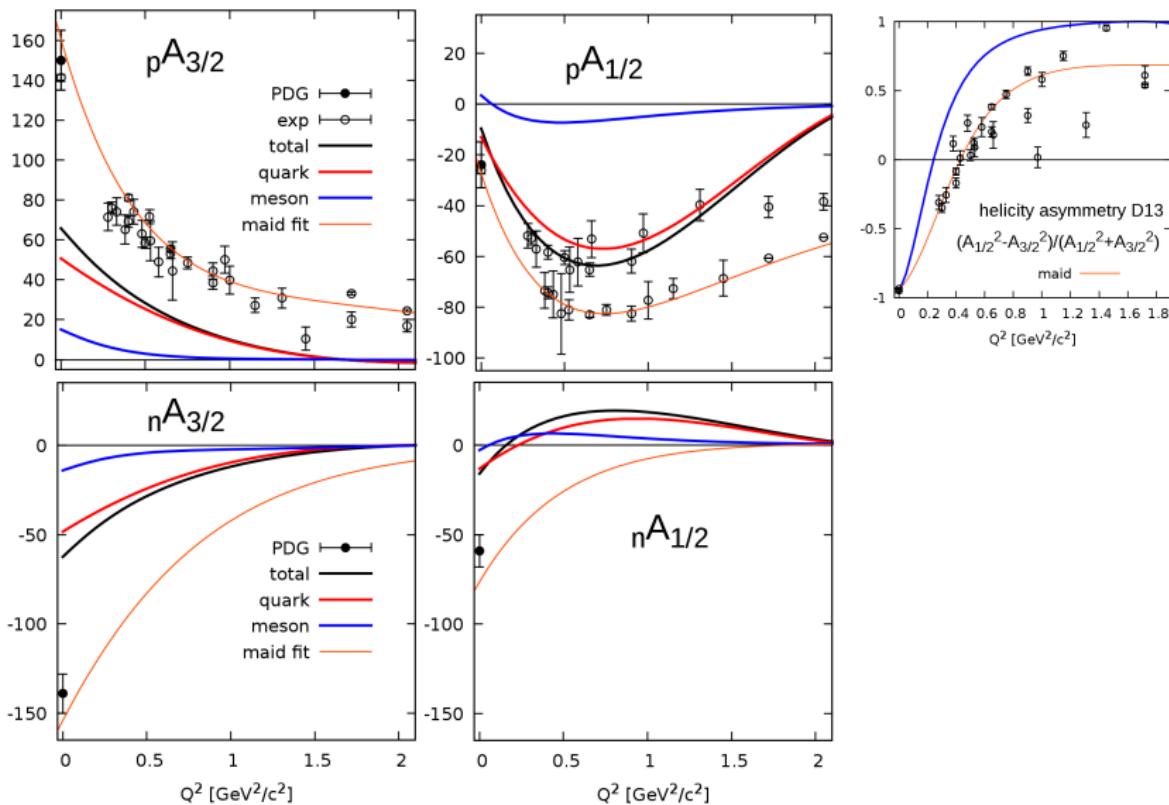

$R = 0.83 \text{ fm}$ :  $g_{\pi NN^*} = 1.7 g_{\pi NN^*} \text{ (QM)}$   
 $g_{\pi \Delta N^*}^{s\text{-wave}} = 0.50 g_{\pi \Delta N^*}^{s\text{-wave}} \text{ (QM)}$ .

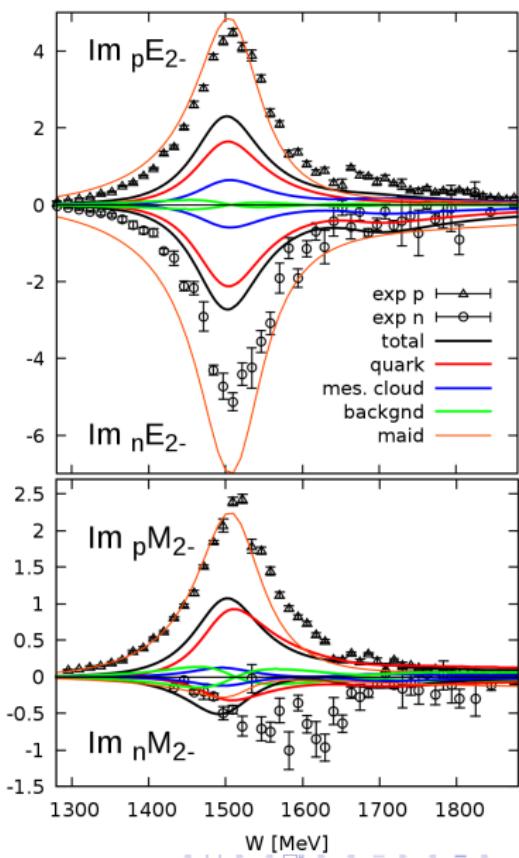

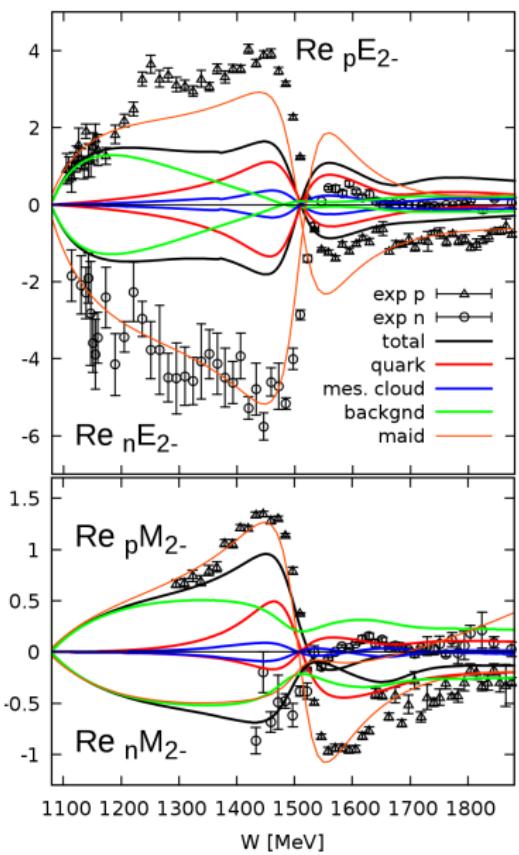

$R = 1.0 \text{ fm}$ :  $g_{\pi NN^*} = 1.43 g_{\pi NN^*} \text{ (QM)}$ ,  
 $g_{\pi \Delta N^*}^{s\text{-wave}} = 0.58 g_{\pi \Delta N^*}^{s\text{-wave}} \text{ (QM)}$ .

# D15: helicity and photo-production amplitudes

# Concluding remarks

- ▶ Pion cloud dominates (over other mesons)
  - ▶ *p*-wave pions: strong contribution of for P11 and P33 resonances; similar results in different chiral quark models
  - ▶ *s*-wave and *d*-wave pions: comparable contribution for the S and D resonances; because of possible cancellations, the results may be model dependent
- ▶  $\eta$ -meson and kaon clouds less important: sizable effects in the region of the upper S11 resonance.
- ▶ Bare masses: typically 200 MeV to 500 MeV higher than the "physical" masses; strange-meson loops contribute  $\sim 10\%$

Where to look for the manifestation of the meson cloud?

# Manifestation of the meson cloud:

- ▶ Clear and "unmistakable" signal
  - ▶ E2/M1 and S2/M1 ratio of helicity amplitudes for  $\Delta(1232)$
- ▶ Strong signal, commonly agreed upon
  - ▶ substantial enhancement of the  $\pi N \Delta(1232)$  vertex
  - ▶ large enhancement of the M1 electro-production amplitude on the  $\Delta$
- ▶ Strong signal but still disputable (model dependent)
  - ▶ zero-crossing of the helicity amplitude for  $N^*(1440)$
  - ▶ substantial enhancement of the the  $\pi NN^*(1440)$  vertex
- ▶ Moderate evidence for a sizable contribution
  - ▶ helicity amplitudes for D33
- ▶ Possible explanation – more elaborate analysis needed
  - ▶ W-dependence of resonance mixing in P33, P11, S11, D13 partial waves
  - ▶ missing strength of the d-wave vertices and helicity amplitudes, in particular for the D13 and D15 partial waves

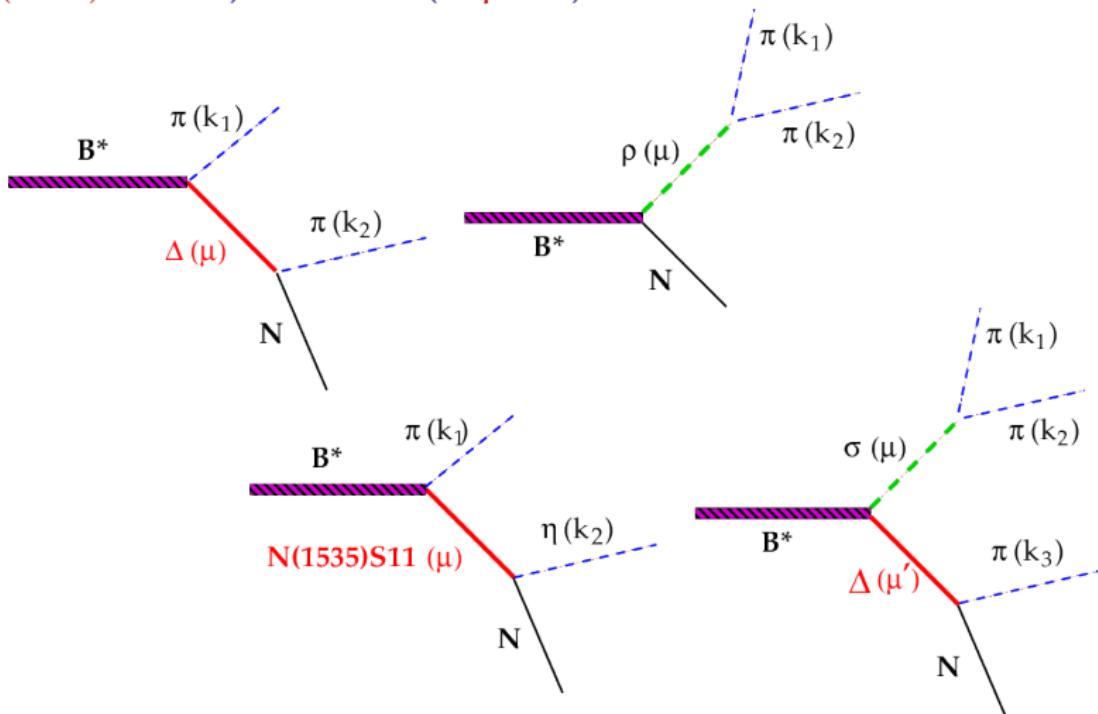

# Self-energy correction (in MeV)

Resonance	pion loops	$\eta\Lambda$ loops	$K\Lambda/K\Sigma$ loops	total
$\Delta(1232)P33$	201.5			201.5
$N(1440)P11$	66.8			66.8
$N(1535)S11$	60.9	24.5	25.2	110.6
$N(1650)S11$	133.0	-3.5	82.7	212.2
$N(1520)D13$	176.1	-	1.5	177.6
$N(1700)D13$	218.0	-	7.7	225.7
$\Delta(1700)D33$	484.3	-	9.3	493.6

# Assumption about the two- and three-meson channels

2 $\pi$ ,  $\pi\eta$  and 3 $\pi$  decays through intermediate baryons ( $\Delta(1232)$ ,  $N(1535)S11, \dots$ ) or mesons ( $\sigma, \rho, \dots$ )

# Intermediate baryon state

For  $\mu \sim M_{\mathcal{R}}$ , the intermediate baryon state can be written as

$$\begin{aligned} |\tilde{\Psi}^\alpha(\mu)\rangle &= \sum_\beta \left(1 + \mathbf{K}^2\right)_{\beta\alpha}^{-\frac{1}{2}} |\Psi^\beta(\mu)\rangle \\ &\approx \frac{1}{\sqrt{2\pi}} \frac{\sqrt{\Gamma_{MB}(\mu)}}{\sqrt{(M_{\mathcal{R}} - \mu)^2 + \frac{1}{4}\Gamma^2(\mu)}} |\hat{\Psi}_{\mathcal{R}}\rangle + \dots, \end{aligned}$$

$\mu$  is the invariant mass of the baryon-meson system into which the intermediate baryon decays.

$\hat{\Psi}_{\mathcal{R}}$  is the three-quark state surrounded by the meson cloud:

$$|\hat{\Psi}_{\mathcal{R}}\rangle = Z_{\mathcal{R}}^{-\frac{1}{2}} \left[ |\Phi_{\mathcal{R}}\rangle - \sum_{MB} \int \frac{dk}{\omega_k + E_B - W} \frac{\mathcal{V}_{B\mathcal{R}}^M(k)}{[a^\dagger(k)|\tilde{\Psi}_B\rangle]^{II}} \right]$$

# Equations for meson amplitudes (Lippmann-Schwinger)

$$\begin{aligned}\chi^{M'B'MB}(k, k_M) = & - \sum_{\mathcal{R}} c_{\mathcal{R}}^{MB} V_{B'\mathcal{R}}^{M'}(k) + \mathcal{K}^{M'B'MB}(k, k_M) \\ & + \sum_{M''B''} \int dk' \frac{\mathcal{K}^{M'B'M''B''}(k, k') \chi^{M''B''MB}(k', k_M)}{\omega'_k + E_{B''}(k') - W}\end{aligned}$$

with kernels

$$\mathcal{K}^{M'B'MB}(k, k') = \sum_{B''} f_{BB'}^{B''} \frac{\mathcal{V}_{B''B'}^{M'}(k') \mathcal{V}_{B''B}^M(k)}{\omega_k + \omega'_k + E_{B''}(\bar{k}) - W}$$

( $f_{BB'}^{B''}$  are spin-isospin coefficients)

The solution assumes the form

$$\chi^{M'B'MB}(k, k_M) = - \sum_{\mathcal{R}} c_{\mathcal{R}}^{MB} \mathcal{V}_{B'\mathcal{R}}^{M'}(k) + \mathcal{D}^{M'B'MB}(k, k_M)$$

# Solving the coupled equations

Dressed vertices then satisfy:

$$\mathcal{V}_{B\mathcal{R}}^M(k) = V_{B\mathcal{R}}^M(k) + \sum_{M'B'} \int dk' \frac{\mathcal{K}^{MBM'B'}(k, k') \mathcal{V}_{B'\mathcal{R}}^{M'}(k')}{\omega_k' + E_{B'}(k') - W}$$

and similarly the background part of the amplitude:

$$\begin{aligned} \mathcal{D}^{M'B'MB}(k, k_M) &= \mathcal{K}^{M'B'MB}(k, k_M) \\ &+ \sum_{M''B''} \int dk' \frac{\mathcal{K}^{M'B'M''B''}(k, k') \mathcal{D}^{M''B''MB}(k', k_M)}{\omega_k' + E_{B''}(k') - W} \end{aligned}$$

The coefficients  $c_{\mathcal{R}'}^{MB}$  in front of the quasi-bound states satisfy a set of equations:

$$\sum_{\mathcal{R}'} A_{\mathcal{R}\mathcal{R}'}(W) c_{\mathcal{R}'}^{MB}(W) = \mathcal{V}_{B\mathcal{R}}^M(k_M)$$

$$A_{\mathcal{R}\mathcal{R}'} = (W - M_{\mathcal{R}}^0) \delta_{\mathcal{R}\mathcal{R}'} + \sum_{B'} \int dk \frac{\mathcal{V}_{B'\mathcal{R}}^{M'}(k) V_{B'\mathcal{R}'}^{M'}(k)}{\omega_k + E_{B'}(k) - W}$$

# Approximation: separable kernels

$$\frac{1}{\omega_k + \omega'_k + E_{B''} - W} \approx \frac{(\omega_M + \omega_{M'} + E_{B''} - W)}{(\omega_k + E_{B''} - E_{B'}) (\omega'_k + E_{B''} - E_B)}$$
$$W = E_B + \omega_M = E_{B'} + \omega_{M'}$$

The approximation has the property:

$$\mathcal{K}^{M'B' MB}(k, k_{M'})^{\text{approx}} = \mathcal{K}^{M'B' MB}(k, k_{M'})^{\text{exact}}$$

and preserves the symmetry of the K-matrix:  $K_{MB, M'B'} = K_{M'B', MB}$  and, as a consequence, the unitarity of the S-matrix.

Further simplification; for  $\mathcal{V}_{BB'}$  entering the kernel  $\mathcal{K}^{M'B' MB}(k, k_M)$ :

$$\mathcal{V}_{BB'}^M(\text{dressed}) = r_{BB'}^M V_{BB'}^M(\text{bare}) \quad r_{BB'}^M = \text{const}$$

e.g.  $r_{N\Delta}^{l=1 \text{ pions}} = 1.3$ , as determined by solving the coupled equations in the P33 partial wave. Most  $r_{BB'}^M = 1$ .

# Mixing of bare resonances

To solve the set of equations, diagonalize  $\mathbf{A}$  to obtain  $U$ , along with the poles of the  $K$  matrix, and wave-function normalization  $Z$ :

$$UAU^T = \begin{bmatrix} Z_{\mathcal{R}}(W)(W - M_{\mathcal{R}}) & 0 & 0 \\ 0 & Z_{\mathcal{R}'}(W)(W - M_{\mathcal{R}'}) & 0 \\ 0 & 0 & Z_{\mathcal{R}''}(W)(W - M_{\mathcal{R}''}) \end{bmatrix}$$

As a consequence,  $\Phi_{\mathcal{R}}$  mix:

$$|\tilde{\Phi}_{\mathcal{R}}\rangle = \sum_{\mathcal{R}'} U_{\mathcal{R}\mathcal{R}'} |\Phi_{\mathcal{R}}\rangle \quad \tilde{\mathcal{V}}_{B\mathcal{R}} = \frac{1}{\sqrt{Z_{\mathcal{R}}(W)}} \sum_{\mathcal{R}'} U_{\mathcal{R}\mathcal{R}'} \mathcal{V}_{B\mathcal{R}'}$$

Solution for the  $K$  matrix

$$K_{MB,M'B'} = \pi \sqrt{\frac{\omega_M E_B}{k_M W}} \sqrt{\frac{\omega_{M'} E_{B'}}{k_{M'} W}} \left[ \sum_{\mathcal{R}} \frac{\tilde{\mathcal{V}}_{B\mathcal{R}}^M \tilde{\mathcal{V}}_{B'\mathcal{R}}^{M'}}{(M_{\mathcal{R}} - W)} + \mathcal{D}_{MB,M'B'} \right]$$

and for the  $T$  matrix

$$T_{MB,M'B'} = K_{MB,M'B'} + i \sum_{M''K''} T_{MB,M''B''} K_{M''B'',M'B'}$$

# Meson-quark vertexes

*quark pion*

$$V_{l=0,t}^\pi(k) = \frac{1}{2f_\pi} \sqrt{\frac{\omega_{p_{1/2}}\omega_s}{(\omega_{p_{1/2}}+1)(\omega_s-1)}} \frac{1}{2\pi} \frac{k^2}{\sqrt{\omega_k}} \frac{j_0(kR)}{kR} \sum_{i=1}^3 \tau_t(i) \mathcal{P}_{sp}(i),$$

$$V_{1mt}^\pi(k) = \frac{1}{2f_\pi} \frac{\omega_s}{(\omega_s-1)} \frac{1}{2\pi} \frac{1}{\sqrt{3}} \frac{k^2}{\sqrt{\omega_k}} \frac{j_1(kR)}{kR} \sum_{i=1}^3 \tau_t(i) \left( \sigma_m(i) + r_{p_{1/2}} S_{1m}^{[1]}(i) + r_{p_{3/2}} S_{1m}^{[3]}(i) \right),$$

$$V_{2mt}^\pi(k) = \frac{1}{2f_\pi} \sqrt{\frac{\omega_{p_{3/2}}\omega_s}{(\omega_{p_{3/2}}-2)(\omega_s-1)}} \frac{\sqrt{2}}{2\pi} \frac{k^2}{\sqrt{\omega_k}} \frac{j_2(kR)}{kR} \sum_{i=1}^3 \tau_t(i) \Sigma_{2m}^{[\frac{1}{2}\frac{3}{2}]}(i).$$

$$\mathcal{P}_{sp} = \sum_{m_j} |sm_j\rangle \langle p_{1/2}m_j|,$$

$$S_{1m}^{[\frac{1}{2}]} = \sqrt{3} \sum_{m_j m'_j} C_{\frac{1}{2}m'_j 1m}^{\frac{1}{2}m_j} |p_{1/2}m_j\rangle \langle p_{1/2}m'_j|,$$

$$\Sigma_{2m}^{[\frac{1}{2}\frac{3}{2}]} = \sum_{m_s m_j} C_{\frac{3}{2}m_j 2m}^{\frac{1}{2}m_s} |sm_s\rangle \langle p_{3/2}m_j|,$$

$$S_{1m}^{[\frac{3}{2}]} = \frac{\sqrt{15}}{2} \sum_{m_j m'_j} C_{\frac{3}{2}m'_j 1m}^{\frac{3}{2}m_j} |p_{3/2}m_j\rangle \langle p_{3/2}m'_j|,$$

$$r_{p_{1/2}} = \frac{\omega_{p_{1/2}}(\omega_s - 1)}{\omega_s(\omega_{p_{1/2}} + 1)}, \quad r_{p_{3/2}} = \frac{2\omega_{p_{3/2}}(\omega_s - 1)}{5\omega_s(\omega_{p_{3/2}} - 2)}.$$

### s-wave $\eta$ and K mesons

$$V^\eta(k) = \frac{1}{2f_\pi} \sqrt{\frac{\omega_{p_{1/2}}\omega_s}{(\omega_{p_{1/2}} + 1)(\omega_s - 1)}} \frac{1}{2\pi} \frac{k^2}{\sqrt{\omega_k}} \frac{j_0(kR)}{kR} \sum_{i=1}^3 \lambda_8(i) \mathcal{P}_{sp}(i),$$

$$V^K_t(k) = \frac{1}{2f_K} \sqrt{\frac{\omega_{p_{1/2}}\omega_s}{(\omega_{p_{1/2}} + 1)(\omega_s - 1)}} \frac{1}{2\pi} \frac{k^2}{\sqrt{\omega_k}} \frac{j_0(kR)}{kR} \sum_{i=1}^3 (V_t(i) + U_t(i)) \mathcal{P}_{sp}(i),$$

$\rho qq$  interaction involving the  $s$ -state and the  $p_{j=1/2}$ -state quarks

$$H_{\rho Jl}^{SP} = \int dk V_{Jl}^{\rho SP}(k) \sum_{i=1}^3 \sum_{Mt} \sigma_M(i) \tau_t(i) a_{1lMt}(k) + \text{h.c.},$$

with possible values  $J = 1$  and  $l = 0, 2$ :

$$V_{10}^{\rho SP}(k) = \frac{1}{4\pi\tilde{f}_\rho} \sqrt{\frac{\omega_{p_{1/2}}\omega_s}{(\omega_{p_{1/2}} + 1)(\omega_s - 1)}} \frac{2}{3} \frac{k^2}{\sqrt{\omega_k}} \frac{j_0(kR)}{kR},$$

$$V_{12}^{\rho SP}(k) = \frac{1}{4\pi\tilde{f}_\rho} \sqrt{\frac{\omega_{p_{1/2}}\omega_s}{(\omega_{p_{1/2}} + 1)(\omega_s - 1)}} \frac{\sqrt{2}}{3} \frac{k^2}{\sqrt{\omega_k}} \frac{j_2(kR)}{kR}.$$

*pqq* interaction between the  $s$ -state and the  $p_{j=3/2}$ -state quarks (SA):

$$H_{\rho Jl}^{SA} = V_{Jl}^{\rho SA}(k) \sum_{i=1}^3 \sum_{Mt} \Sigma_{JM}^{[\frac{3}{2} \frac{1}{2}]}(i) \tau_t(i) a_{JMt}(k) + \text{h.c.}$$

with  $J = 1, l = 0, 2$  and  $J = 2, l = 2$ :

$$V_{10}^{\rho SA}(k) = \frac{1}{4\pi\tilde{f}_\rho} \sqrt{\frac{\omega_{p_{3/2}}\omega_s}{(\omega_{p_{3/2}} - 2)(\omega_s - 1)}} \frac{1}{\sqrt{3}} \frac{k^2}{\sqrt{\omega_k}} \frac{j_0(kR)}{kR},$$

$$V_{12}^{\rho SA}(k) = -\frac{1}{4\pi\tilde{f}_\rho} \sqrt{\frac{\omega_{p_{3/2}}\omega_s}{(\omega_{p_{3/2}} - 2)(\omega_s - 1)}} \frac{1}{\sqrt{6}} \frac{k^2}{\sqrt{\omega_k}} \frac{j_2(kR)}{kR},$$

$$V_{22}^{\rho SA}(k) = -\frac{1}{4\pi\tilde{f}_\rho} \sqrt{\frac{\omega_{p_{3/2}}\omega_s}{(\omega_{p_{3/2}} - 2)(\omega_s - 1)}} \sqrt{\frac{3}{2}} \frac{k^2}{\sqrt{\omega_k}} \frac{j_2(kR)}{kR},$$

$$\langle \frac{3}{2}m_j | \Sigma_{JM}^{[\frac{3}{2} \frac{1}{2}]} | \frac{1}{2}m_s \rangle = C_{\frac{1}{2}m_s JM}^{\frac{3}{2}m_j}$$
