Parton showers in a nutshell

SLAC

Color coherence and the dipole picture

SLAC

[Marchesini,Webber] NPB310(1988)461

- ▶ Gluons with large wavelength not capable of resolving charges of emitting color dipole individually

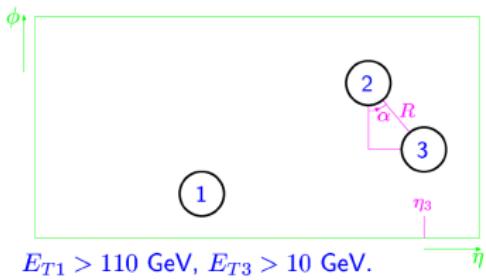

- ▶ Emission occurs with combined charge of mother parton instead
- ▶ Net effect is destructive interference outside cone with opening angle defined by emitting color dipole
- ▶ Soft anomalous dimension Δ is halved as a consequence of changed z -bounds

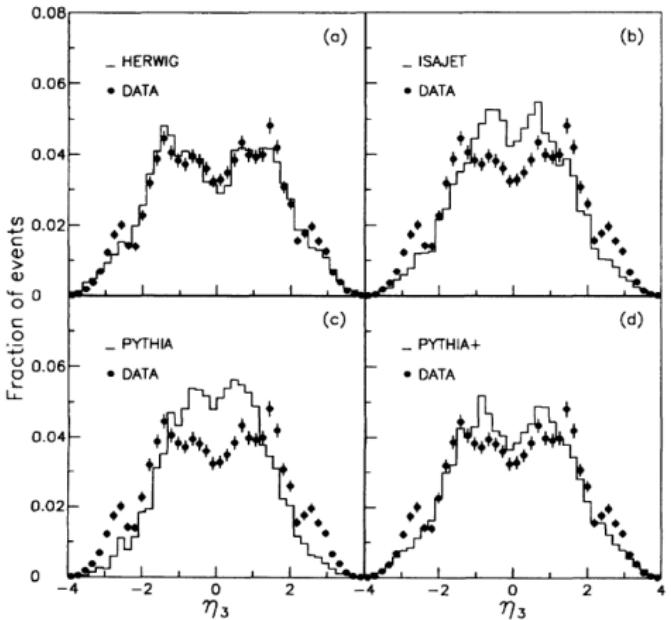

Color coherence and the dipole picture

SLAC

- ▶ Observed in 3-jet events
- ▶ Purely virtuality ordered PS's produced too much radiation in central region
- ▶ Angular ordered / angular vetoed PS's ok

[CDF] PRD50(1994)5562

Color coherence and the dipole picture

SLAC

[Nagy] hep-ph/0601021 [Schumann,Krauss] arXiv:0709.1027
[Plätzer,Gieseke] arXiv:0909.5593

- ▶ Angular ordered PS does not fill full phase space → prefer alternative solution of coherence problem
- ▶ Coherence from eikonal factors Rewrite à la [Catani,Seymour] hep-ph/9605323

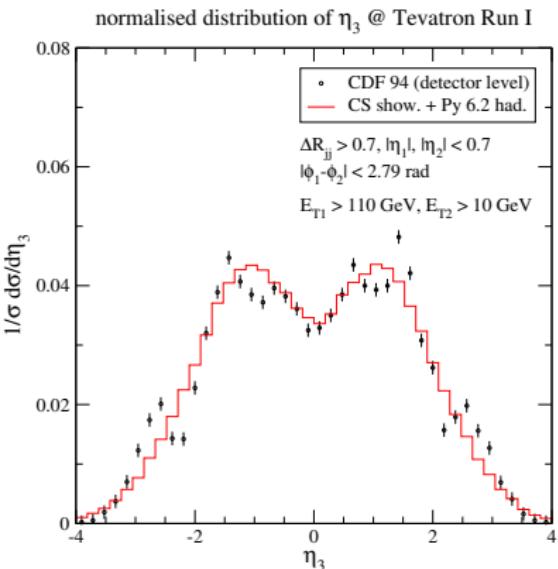

$$\frac{p_i p_k}{(p_i q)(q p_k)} \rightarrow \frac{1}{p_i q} \frac{p_i p_k}{(p_i + p_k)q} + \frac{1}{p_k q} \frac{p_i p_k}{(p_i + p_k)q}$$

- ▶ "Spectator"-dependent PS kernels

$$\frac{1}{1-z} \rightarrow \frac{1-z}{(1-z)^2 + \kappa^2} \quad \kappa^2 = \frac{k_\perp^2}{Q^2}$$

Singular in soft-collinear region only

- ▶ Captures dominant coherence effects (3-parton correlations)
- ▶ Does not account for sub-leading color effects

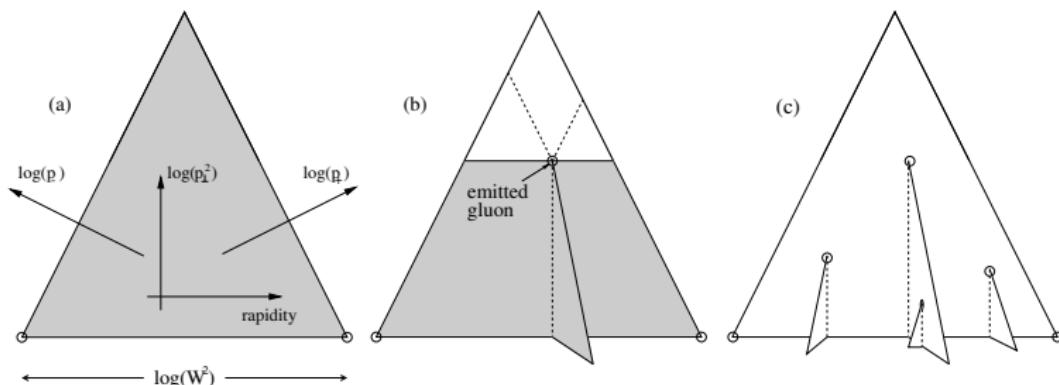

Color coherence and the dipole picture

SLAC

[Gustafsson,Pettersson] NPB306(1988)746
[Kharraziha,Lönnblad] hep-ph/9709424

- To obtain correct soft evolution, ordering variable must be identical for both “dipole ends” (\rightarrow recombine eikonal at integrand level)

- Solution found in LDC model, but initial state treated non-perturbatively
- Alternative approach [Winter,Krauss] arXiv:0712.3913

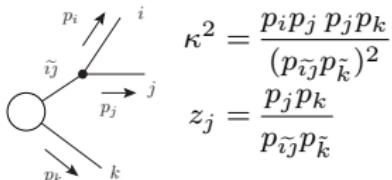

Color coherence and the dipole picture

SLAC

[Prestel,SH] arXiv:1506.05057

Choose parametrization such that soft term is $\frac{1-z}{(1-z)^2 + \kappa^2}$ in all dipole types

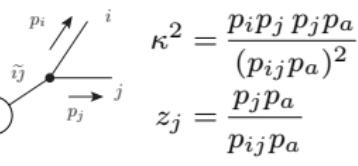

(1) FF

$$\kappa^2 = \frac{p_i p_j p_j p_k}{(p_{i\tilde{j}} p_{\tilde{k}})^2}$$

$$z_j = \frac{p_j p_k}{p_{i\tilde{j}} p_{\tilde{k}}}$$

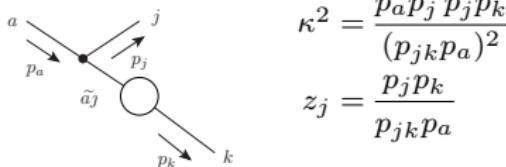

(2) FI

$$\kappa^2 = \frac{p_i p_j p_j p_a}{(p_{i\tilde{j}} p_a)^2}$$

$$z_j = \frac{p_j p_a}{p_{i\tilde{j}} p_a}$$

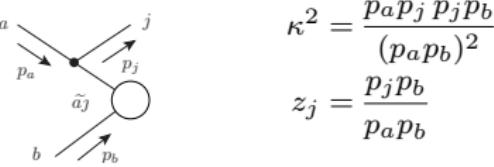

(3) IF

$$\kappa^2 = \frac{p_a p_j p_j p_k}{(p_{j\tilde{k}} p_a)^2}$$

$$z_j = \frac{p_j p_k}{p_{j\tilde{k}} p_a}$$

(4) II

$$\kappa^2 = \frac{p_a p_j p_j p_b}{(p_a p_b)^2}$$

$$z_j = \frac{p_j p_b}{p_a p_b}$$

- ▶ Phase-space factorization from [Catani,Seymour] hep-ph/9605323
- ▶ z_j can be interpreted as light-cone momentum fraction of emitted parton
→ mapping onto collinear limit becomes trivial

The midpoint between dipole and parton showers

SLAC

[Prestel,SH] arXiv:1506.05057

Construction principles for a hybrid shower

- ▶ Dipole-like picture (emitter & spectator identified)
- ▶ Properties of evolution variables from dipole cascades
- ▶ Collinear anomalous dimensions unchanged
- ▶ Flavor and momentum sum rules preserved

Defines complete set of LO splitting functions

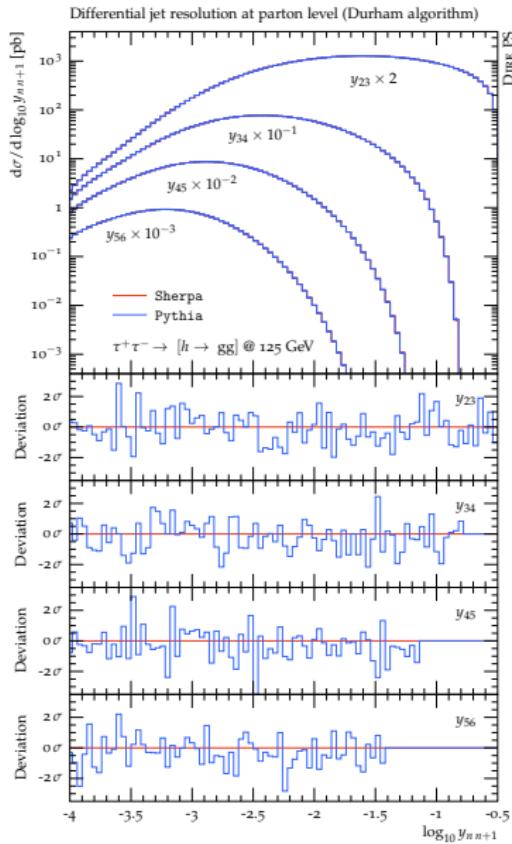

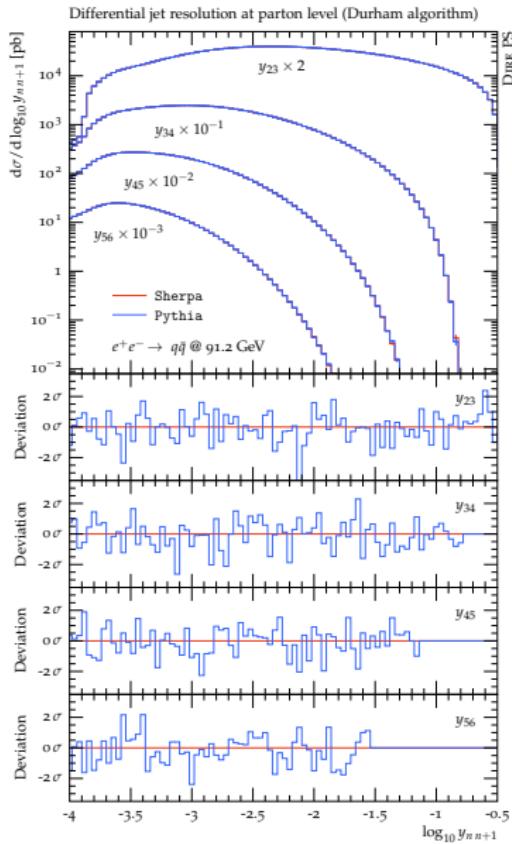

$$P_{qq}(z, \kappa^2) = 2 C_F \left[\left(\frac{1-z}{(1-z)^2 + \kappa^2} \right)_+ - \frac{1+z}{2} \right] + \gamma_q \delta(1-z)$$

$$P_{gg}(z, \kappa^2) = 2 C_A \left[\left(\frac{1-z}{(1-z)^2 + \kappa^2} \right)_+ + \frac{z}{z^2 + \kappa^2} - 2 + z(1-z) \right] + \gamma_g \delta(1-z)$$

$$P_{qg}(z, \kappa^2) = 2 C_F \left[\frac{z}{z^2 + \kappa^2} - \frac{2-z}{2} \right] \quad P_{gq}(z, \kappa^2) = T_R \left[z^2 + (1-z)^2 \right]$$

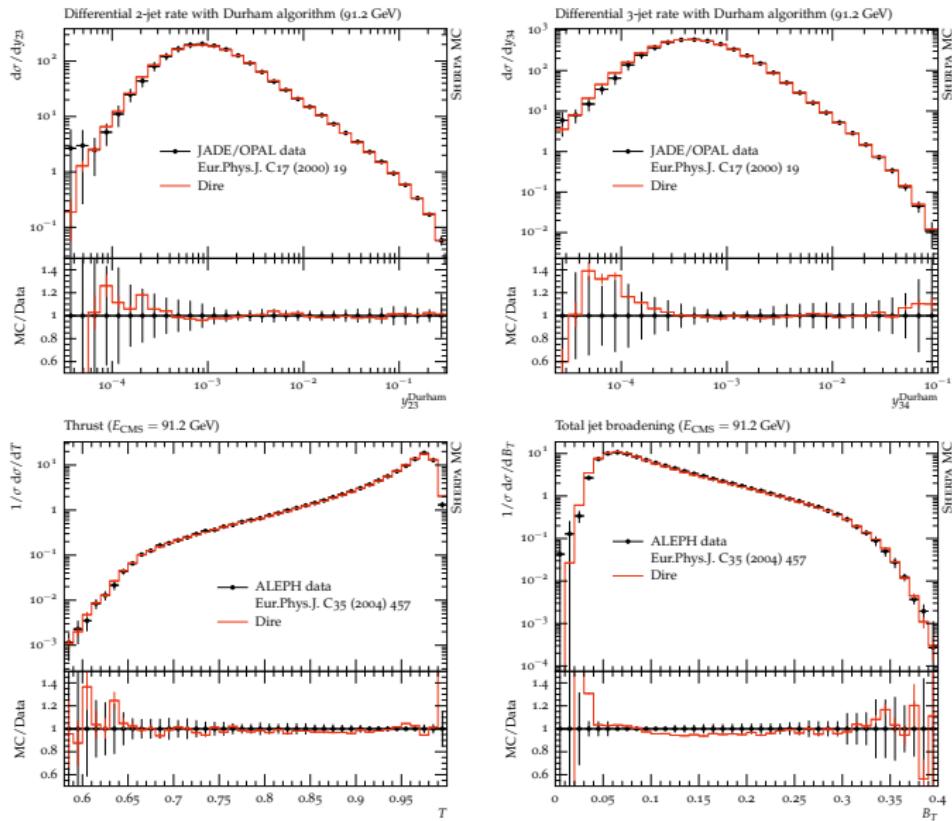

The midpoint between dipole and parton showers

SLAC

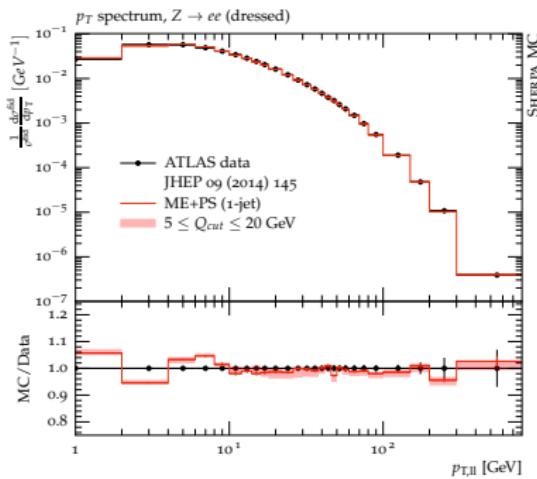

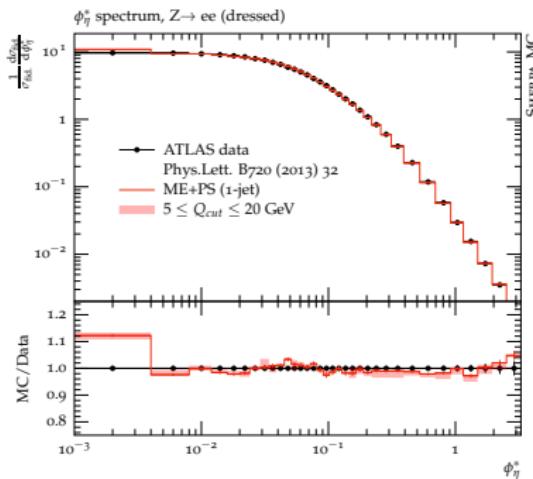

The midpoint between dipole and parton showers

Extension to a subtraction method and MC@NLO

SLAC

[SH] TBP?

- ▶ Can view new shower model as modification of CS subtraction
- ▶ IR-finite counterterms computed and implemented in Sherpa
(improved cancellation in $pp \rightarrow h + j$ due to regulated $1/z$ terms)
- ▶ Sherpa MC@NLO based on exponentiation of CS dipole subtraction terms
[Krauss,Sieger,Schönherr,SH]
arXiv:1111.1220, arXiv:1208.2815
- ▶ Dire modified CS subtraction automatically available for MC@NLO matching
- ▶ Interesting differences due to evolution variables and kernels

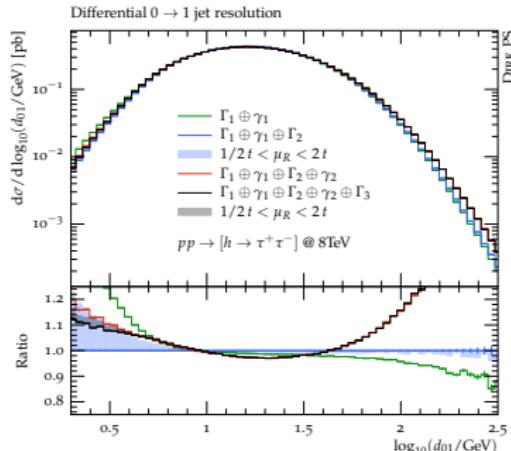

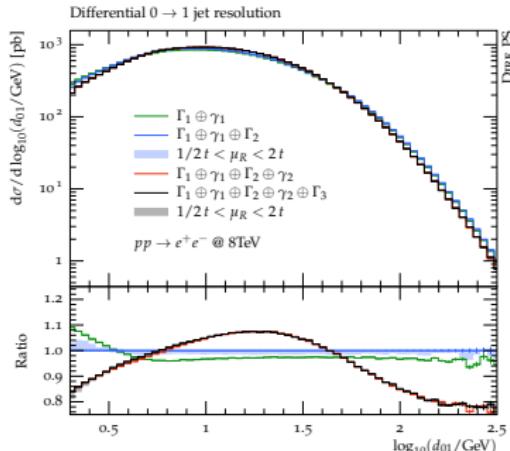

Towards higher logarithmic accuracy

SLAC

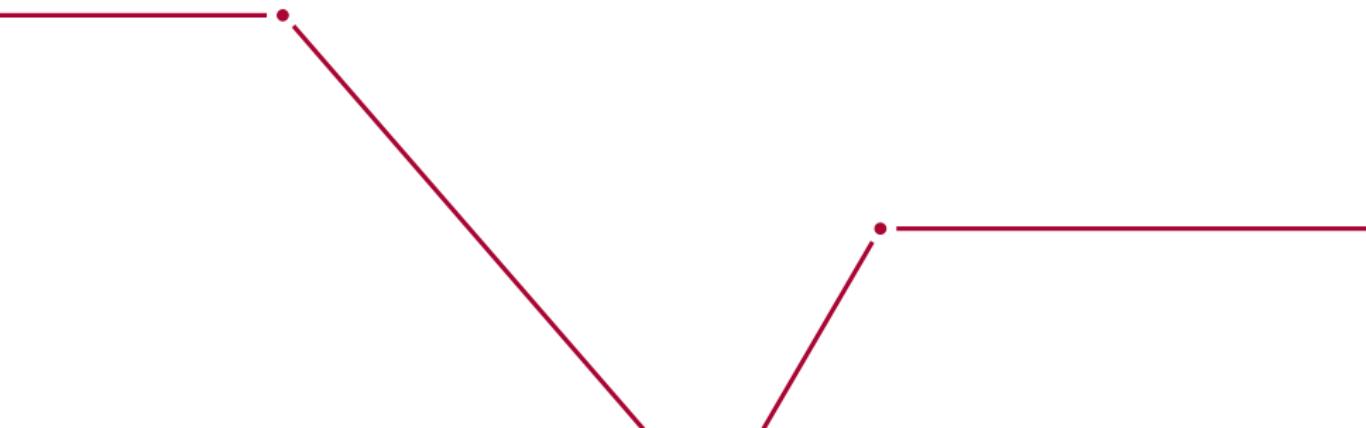

[Krauss,Li,Prestel,Schönherr,SH] TBP!

- ▶ Big drawback of parton showers is lack of higher-order kernels
- ▶ Start improving with spacelike NLO splitting functions
[Curci,Furmanski,Petronzio] NPB175(1980)27, PLB97(1980)437
- ▶ 2-loop cusp term subtracted & combined with LO soft contribution
(similar to CMW rescaling [Catani,Marchesini,Webber] NPB349(1991)635)
- ▶ Implemented using weighting algorithms [Schumann,Siegert,SH] arXiv:0912.3501

- ▶ Parton showers are indispensable tools for
 - ▶ phenomenology
 - ▶ experimental analysis
 - ▶ experiment design
- ▶ Matching at (N)NLO & merging at (N)LO can improve PS approximation at fixed jet multiplicity
→ focus area of development during past decade
- ▶ Genuine reduction of uncertainties can only be achieved by improved resummation
- ▶ Incorporation of sub-leading logarithms just started ... stay tuned!

Thank you for your attention!

Dire anomalous dimensions

In the notation of NPB244(1984)337, $\gamma_{ab}(N, \kappa^2) = \int_0^1 dz z^N P_{ab}(z, \kappa^2)$:

$$\gamma_{qq}(N, \kappa^2) = 2C_F \Gamma(N, \kappa^2) - \frac{C_F (2N + 3)}{(N + 1)(N + 2)} + \gamma_q$$

$$\gamma_{gq}(N, \kappa^2) = 2C_F K(N, \kappa^2) - \frac{C_F (N + 3)}{(N + 1)(N + 2)}$$

$$\gamma_{gg}(N, \kappa^2) = 2C_A \Gamma(N, \kappa^2) + 2C_A K(N, \kappa^2) - \frac{2C_A (N + 3)}{(N + 1)(N + 2)} - \frac{2C_A}{N + 3} + \gamma_g$$

$$\gamma_{qg}(N, \kappa^2) = - \frac{T_R N}{(N + 1)(N + 2)} + \frac{2T_R}{N + 3}$$

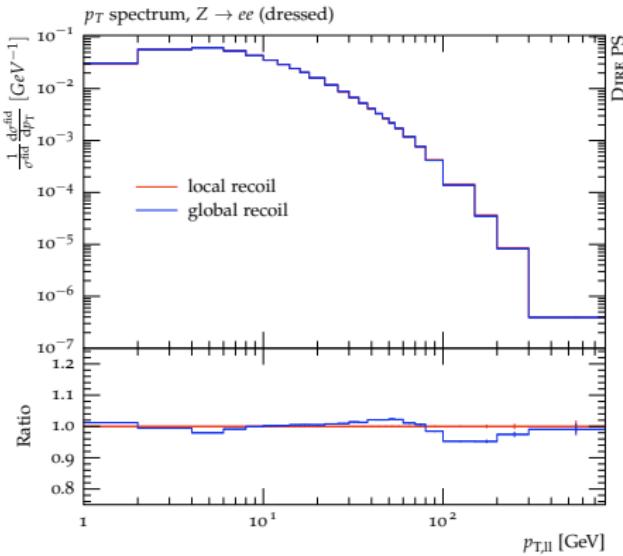

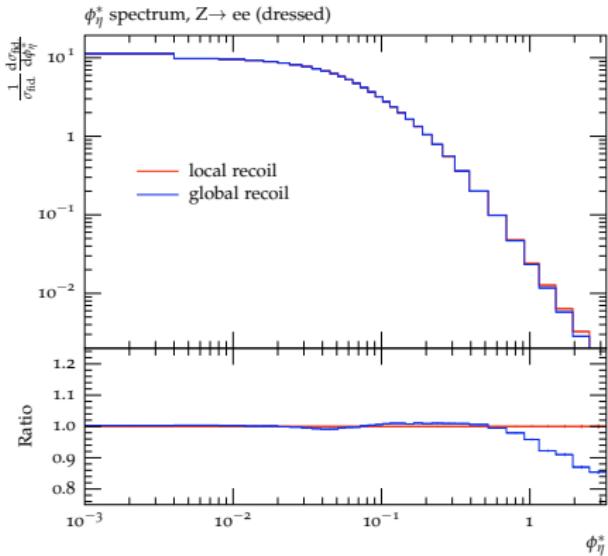

where

$$2\Gamma(N, \kappa^2) = \frac{2 {}_3F_2 \left(1, 1, \frac{3}{2}; \frac{N+3}{2}, \frac{N+4}{2}; -\kappa^{-2}\right)}{(N + 1)(N + 2) \kappa^2} - \ln \frac{1 + \kappa^2}{\kappa^2}$$

$$2K(N, \kappa^2) = \frac{2 {}_2F_1 \left(1, \frac{N+2}{2}; \frac{N+4}{2}; -\kappa^{-2}\right)}{(N + 2) \kappa^2}.$$

Dire kinematics mapping

SLAC

- ▶ Two mapping schemes for IF dipoles → local [Catani,Seymour] hep-ph/9605323 and global [Plätzer,Gieseke] arXiv:0909.5593, [Schumann,Siegert,SH] arXiv:0912.3501
- ▶ Negligible impact on q_T -spectrum in low- q_T range
(spectrum dominated by singlet evolution at LHC energies)

- ▶ Leading-order calculation for observable O

$$\langle O \rangle = \int d\Phi_B B(\Phi_B) O(\Phi_B)$$

- ▶ NLO calculation for same observable

$$\langle O \rangle = \int d\Phi_B \left\{ B(\Phi_B) + \tilde{V}(\Phi_B) \right\} O(\Phi_B) + \int d\Phi_R R(\Phi_R) O(\Phi_R)$$

- ▶ Parton-shower result (until first emission)

$$\langle O \rangle = \int d\Phi_B B(\Phi_B) \mathcal{F}_{\text{MC}}(\mu_Q^2, O)$$

- ▶ Leading-order calculation for observable O

$$\langle O \rangle = \int d\Phi_B B(\Phi_B) O(\Phi_B)$$

- ▶ NLO calculation for same observable

$$\langle O \rangle = \int d\Phi_B \left\{ B(\Phi_B) + \tilde{V}(\Phi_B) \right\} O(\Phi_B) + \int d\Phi_R R(\Phi_R) O(\Phi_R)$$

- ▶ Parton-shower result (until first emission)

$$\langle O \rangle = \int d\Phi_B B(\Phi_B) \left[\Delta^{(K)}(t_c) O(\Phi_B) + \int_{t_c} d\Phi_1 K(\Phi_1) \Delta^{(K)}(t(\Phi_1)) O(\Phi_R) \right]$$

Phase space: $d\Phi_1 = dt dz d\phi J(t, z, \phi)$

Splitting functions: $K(t, z) \rightarrow \alpha_s/(2\pi t) \sum P(z) \Theta(\mu_Q^2 - t)$

Sudakov factors: $\Delta^{(K)}(t) = \exp \left\{ - \int_t d\Phi_1 K(\Phi_1) \right\}$

- ▶ Leading-order calculation for observable O

$$\langle O \rangle = \int d\Phi_B B(\Phi_B) O(\Phi_B)$$

- ▶ NLO calculation for same observable

$$\langle O \rangle = \int d\Phi_B \left\{ B(\Phi_B) + \tilde{V}(\Phi_B) \right\} O(\Phi_B) + \int d\Phi_R R(\Phi_R) O(\Phi_R)$$

- ▶ Parton-shower result (until first emission)

$$\begin{aligned} \langle O \rangle = & \int d\Phi_B B(\Phi_B) \left[\Delta^{(K)}(t_c) O(\Phi_B) + \int_{t_c} d\Phi_1 K(\Phi_1) \Delta^{(K)}(t(\Phi_1)) O(\Phi_R) \right] \\ & \stackrel{\mathcal{O}(\alpha_s)}{\rightarrow} \int d\Phi_B B(\Phi_B) \left\{ 1 - \int_{t_c} d\Phi_1 K(\Phi_1) \right\} O(\Phi_B) + \int_{t_c} d\Phi_B d\Phi_1 B(\Phi_B) K(\Phi_1) O(\Phi_R) \end{aligned}$$

Phase space: $d\Phi_1 = dt dz d\phi J(t, z, \phi)$

Splitting functions: $K(t, z) \rightarrow \alpha_s/(2\pi t) \sum P(z) \Theta(\mu_Q^2 - t)$

Sudakov factors: $\Delta^{(K)}(t) = \exp \left\{ - \int_t d\Phi_1 K(\Phi_1) \right\}$

- Subtract $\mathcal{O}(\alpha_s)$ PS terms from NLO result ($t_c \rightarrow 0$)

$$\langle O \rangle = \int d\Phi_B \left\{ B(\Phi_B) + \tilde{V}(\Phi_B) + B(\Phi_B) \int d\Phi_1 K(\Phi_1) \right\} O(\Phi_B) \\ + \int d\Phi_R \left\{ R(\Phi_R) - B(\Phi_B) K(\Phi_1) \right\} O(\Phi_R)$$

- In DLL approximation both terms finite → MC events in two categories, Standard and Hard

$$\mathbb{S} \rightarrow \bar{B}^{(K)}(\Phi_B) = B(\Phi_B) + \tilde{V}(\Phi_B) + B(\Phi_B) \int d\Phi_1 K(\Phi_1)$$

$$\mathbb{H} \rightarrow H^{(K)} = R(\Phi_R) - B(\Phi_B) K(\Phi_1)$$

- Full QCD has color & spin correlations → **NLO subtraction** needed
 $1/N_c$ corrections faded out in soft region by **smoothing function**

$$\bar{B}^{(K)}(\Phi_B) = B(\Phi_B) + \tilde{V}(\Phi_B) + I(\Phi_B) + \int d\Phi_1 \left[S(\Phi_R) - B(\Phi_B) K(\Phi_1) \right] f(\Phi_1)$$

$$H^{(K)}(\Phi_R) = \left[R(\Phi_R) - B(\Phi_B) K(\Phi_1) \right] f(\Phi_1)$$

[Frixione,Webber] JHEP06(2002)029

- Add parton shower, described by generating functional \mathcal{F}_{MC}

$$\langle O \rangle = \int d\Phi_B \bar{B}^{(K)}(\Phi_B) \mathcal{F}_{\text{MC}}^{(0)}(\mu_Q^2, O) + \int d\Phi_R H^{(K)}(\Phi_R) \mathcal{F}_{\text{MC}}^{(1)}(t(\Phi_R), O)$$

Probability conservation $\leftrightarrow \mathcal{F}_{\text{MC}}(t, 1) = 1$

- Expansion of matched result until first emission

$$\begin{aligned} \langle O \rangle = & \int d\Phi_B \bar{B}^{(K)}(\Phi_B) \left[\Delta^{(K)}(t_c) O(\Phi_B) \right. \\ & \left. + \int_{t_c} d\Phi_1 K(\Phi_1) \Delta^{(K)}(t(\Phi_1)) O(\Phi_R) \right] + \int d\Phi_R H^{(K)}(\Phi_{n+1}) O(\Phi_R) \end{aligned}$$

- Parametrically $\mathcal{O}(\alpha_s)$ correct
- Preserves logarithmic accuracy of PS

Treatment of soft singularities

SLAC

Method 1

[Frixione,Webber] JHEP06(2002)029

- ▶ $f(\Phi_1) \rightarrow 0$ in soft-gluon limit
- ▶ Full NLO only in hard / collinear region
Missing subleading color terms in soft domain
- ▶ Only affects unresolved gluons \rightarrow no need to correct in principle

Method 2

[Krauss,Schönherr,Siegert,SH] JHEP09(2012)049

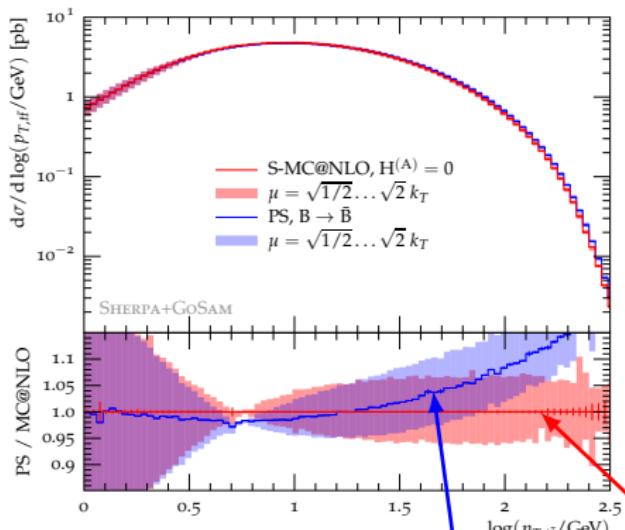

- ▶ Replace $B(\Phi_B)K(\Phi_1) \rightarrow S(\Phi_R)$, i.e. include color & spin correlations
- ▶ May lead to non-probabilistic Sudakov factor $\Delta^{(S)}(t)$
Requires modification of veto algorithm
- ▶ Exact cancellation of all divergences without additional smoothing
Equivalent to one-step full colour parton shower algorithm

Does it make a difference?

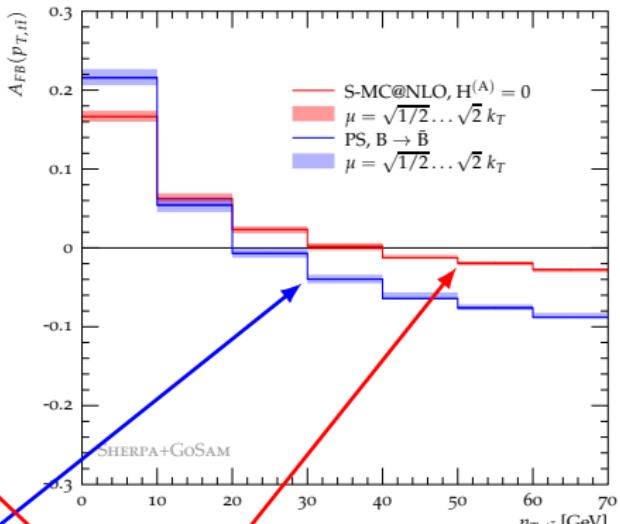

SLAC

[Huang,Luisoni,Schönherr,Winter,SH] arXiv:1306.2703

► Top-quark pair p_T

► Forward-backward asymmetry

leading color

full color (first shower step)

Non-standard veto algorithm

[Siegert,Schumann,SH] arXiv:0912.3501

- In MC@NLO generate emission according to

$$\Delta^{(S)}(t, t') = \exp \left\{ - \int_t^{t'} d\Phi_1 \frac{S(\Phi_B; t, z, \phi)}{B(\Phi_B)} \right\}$$

- “dipole-term-correct” PS

$$f(t) \rightarrow \int dz d\phi J(t, z, \phi) \frac{S(\Phi_B; t, z, \phi)}{B(\Phi_B)}$$

$$g(t) \rightarrow \int dz d\phi J(t, z, \phi) K(t, z, \phi)$$

- $f(t)/g(t)$ may be negative e.g. due to subleading color dipoles
→ probabilistic interpretation not possible
- Split weight into MC and analytic part using auxiliary function $h(t)$

$$\frac{f(t)}{h(t)} g(t) \exp \left\{ - \int_t^{t_1} d\bar{t} g(\bar{t}) \right\} \prod_{i=1}^n \left[\int_{t_{i-1}}^{t_{i+1}} dt_i \left(1 - \frac{f(t_i)}{h(t_i)} \right) g(t_i) \exp \left\{ - \int_{t_i}^{t_{i+1}} d\bar{t} g(\bar{t}) \right\} \right]$$

$$w(t, t_1, \dots, t_n) = \frac{h(t)}{g(t)} \prod_{i=1}^n \frac{h(t_i)}{g(t_i)} \frac{g(t_i) - f(t_i)}{h(t_i) - f(t_i)}$$

- $h(t)$ can be chosen freely, as long as $\text{sgn}(h) = \text{sgn}(f)$, $|f| < |h|$
